

Snowy Owl

Nyctea scandiac

The aloof stares of Snowy Owls have inspired artists and writers to bring the image of this native of the arctic tundra into popular imagination. Special friend and mail dispatcher for Harry Potter, Headwig has her talons full. In J.K. Rowling's Harry Potter books Headwig is hand-picked by Hagrid for Harry's 11th birthday. Headwig is a beautiful Snowy Owl whose mind is as quick as her hunting reflexes!

While the Latin name for the Snowy Owl is *Nyctea scandiaca*, this type of owl has various nicknames today, including: Ghost of the Tundra, Snowy (and/or plural Snowies), and White Shadow. Interestingly, Harry isn't the only one to adopt and admire a Snowy Owl; the Canadian province of Quebec made the Snowy Owl its provincial bird in 1987.

If you think Snowies are swell, you're certainly not alone.

Characteristics

The largest owl in North America, fully-grown Snowy Owls measure 53 to 66 cm (21 to 26 inches) and weigh 1.6 to 2.7 kg (3.6 to 6 pounds). Female Snowies are typically 10 to 12 cm (4 to 5 inches) larger than their male counterparts.

The feathers of male Snowies are white, while females are mostly white with brown markings. These subtle differences in colour aid the Snowy Owls in their fairly distinct roles: the male, blending into the snowy landscape of the arctic, hunts for food to bring back to the female who

waits at the nest – the female blends into the earthy colours of the nest, concealing herself and her eggs/owlets from predators.

Snowies are well insulated against their Arctic environment and are able to withstand temperatures as cold as –40 degrees Celsius (-40 degrees Fahrenheit).

While most owls hunt only during the night, Snowy Owls hunt during daylight and darkness. The eyes of a Snowy Owl are similar in some ways to human eyes: yellow irises (the coloured membrane of the eye, surrounding the pupil) face to the front for optimal binocular vision. Snowies blink with their upper eyelids, not their lower; and their eyes are framed by eyelashes. Snowies eyes are about the size of an adult human's eyes but are contained within a skull that is quite a bit smaller than the average adult human head!

All owls have keen hearing and can locate the source and coordinates of interesting sounds without the aid of vision. Snowy Owls, like all owls, can see in all directions by completing a three-quarter turn of their head without moving their bodies.

Life Cycle

After mating with the male, the female Snowy Owl scratches out a place for her nest along the ground where she lays as many as 16 white eggs. The female Snowy may not lay any eggs at all if food is scarce.

If eggs are laid, the female keeps them warm and safe from predators for a period of 32 or 33 days. Small owlets hatch the eggs and emerge with thin, white feathers.

By the time the owlets are between 45 to 50 days old, they will have learned to fly. Learning how to hunt independently takes longer; after about 60 days owlets are hunting by themselves.

Males rarely breed before the age of 3 or 4. Some older, aggressive males form nests with two different females. These males will hunt and protect both nests and surrounding territories. The male Snowy will do most of the hunting during the period from the laying of eggs to the relative independence of the owlets. Females stay at the nest; eggs and small owlets left uncovered in the Arctic cold would freeze.

The full breeding cycle, from the laying of eggs to the departure of the owlets is about 3 and a half months, virtually the entire arctic summer.

Snowy Owls may reach the age of 15 in the wild and can live up to 28 years in captivity.

Habitat

Snowy Owls inhabit the harsh climate of the Arctic regions in Asia, Europe, and North America. Snowy Owls prefer to nest in open areas with slight elevations for two reasons: to avoid damp ground, and to be able to see their surroundings quickly and clearly.

As carnivores, Snowies hunt a variety of small mammals such as rodents, rabbits, and lemmings; birds such as ducks, grebes, chickens, jaegers, eiders, songbirds, gulls, grouse, and geese; fish; weasels and foxes; and carrion. Snowy Owls are opportunistic hunters, often waiting for prey to get close to them before striking.

A large portion of the Snowy Owl's diet in the summer is lemmings. These small rodents dig tunnels below the ground; entrances to these tunnels are favourite spots for Snowies to await their next meal. Some researchers estimate that adult Snowies eat about five lemmings per day.

Behaviour

Often during winter months in North America, Snowies may be seen in southern Canada and northern United States. Being very adaptable, not all Snowy Owls will migrate south when winter arrives; some will choose to stay in the Arctic and hunt during the three months of 24-hour darkness.

The decision to migrate depends upon the availability of food in the Snowy Owl's current territory. For example, if the lemming population is low in their Arctic home, Snowies will likely migrate south in order to find a larger food supply. Conversely, if the summer hunting season has been plentiful, Snowies may decide to remain in the Arctic even though winter hunting may be sporadic.

Snowy Owls are very protective of their young and drive away potential threats to their nests, such as humans, dogs, foxes, wolves, and caribou. The territory around the nest Snowies claim is quite large: up to 6.5 km (4 miles) in total.

While Snowy Owls are territorial, they have no fixed attachment to particular breeding grounds. Snowies are nomadic in their movement around the Arctic and will nest wherever food is abundant.

Threats

Snowy Owls are not endangered but are protected by law. They have few natural predators. Foxes and gulls will occasionally attack very young owlets but the adult Snowies are very well equipped to protect their young. The two biggest threats to Snowies are global warming and human beings.

Changing Arctic climate conditions may affect the breeding of lemmings and consequently the food supply of Snowy Owls. Changing weather conditions, such as an early winter thaw in May, can bring lemmings out from their tunnels about a month earlier than normal. As a result, Snowies may be tricked into early breeding by the appearance of a plentiful hunting season. Unfortunately, there may not be enough lemmings to support the appetites of growing owlets and many may die.

Sometimes humans may injure a Snowy Owl intentionally or unintentionally. Poachers can be a problem and obviously have an adverse effect on the Snowy Owl population. In the winter months Snowies may migrate to unsafe places. Airports, for example, are quite similar to the Snowy Owl's Arctic home: treeless and flat. Often Snowies will sit on the white lines of the runways while looking for rodents. Unfortunately, airports are not the safest environments for Snowies and occasionally some are hit by planes.

What We Can Do To Help

Firstly, never intentionally harm a Snowy Owl! Never take injured or uninjured wildlife home: frequently this practice is considered illegal and quite dangerous. If you find an injured Snowy Owl call local wildlife authorities immediately.

Reuse and recycle: take care of the environment around you! Conscientious environmental practices will help Snowies and other wildlife as well. Contact local wildlife organizations to donate time and/or money to wildlife in your area – your contribution can make a difference.

Where & When to View the Snowy Owl

Snowy Owls typically spend summers in the high arctic, but in the winter often live in the southern regions of Canada and the northern areas of the United States. In the winter they can be seen in

areas that resemble the arctic tundra. Snowy Owls are not exclusively night owls so they can be seen during daylight hours.

The Bird Studies Canada and Audubon organizations sponsor bird counts which track sightings of birds by bird enthusiasts. For example, in British Columbia there were 11 recorded sightings of the Snowy Owl in the 2004-2005 Christmas Bird Count. See the Bird Studies Canada and Audubon websites listed in the Web Resources section for more details.
